archaeologists have focused their attention on identifying the function of prehistoric sites and settlement practices during the Early Archaic period (ca. 9,000-10,500 B.P.). The Hardaway site in the North Carolina Piedmont, one of the most important archaeological sites in eastern North America, has not yet figured notably in this research. Daniel's reanalysis of the Hardaway artifacts provides a broad range of evidence—including stone tool morphology, intrasite distributions of artifacts, and regional distributions of stone raw material types—that suggests that Hardaway played a unique role in Early Archaic settlement. The Hardaway site functioned as a base camp where hunting and gathering groups lived for extended periods. From this camp they exploited nearby stone outcrops in the Uwharrie Mountains to

replenish expended toolkits. Based on the results of this study, Daniel's new model proposes that settlement was conditioned less by the availability of food resources than by the limited distribution of high-quality knappable stone in the region. These results challenge the prevalent view of Early Archaic settlement that group movement was largely confined by the availability of food resources within major southeastern river valleys.

Food webs describe biological communities in terms of feeding interactions. This book integrates the latest work on community dynamics, ecosystems energetics, and stability to dispel categorisation of the field into separate subdisciplines of population, community, and ecosystem ecology.

In Chapter 4, my goal was to determine the habitat characteristics and landscape variables influencing spider functional groups directly and indirectly. Using structural equation modeling, I found that web spiders were negatively correlated with plant biomass, hunting spiders were positively associated with available prey breadth, and both spider functional groups were positively correlated with heavy-metal pollution in the soil.

While soil ecologists continue to be on the forefront of research on biodiversity and ecosystem function, there are

few interdisciplinary studies that incorporate ecological knowledge into sustainable land management practices. Conventional, high fossil-fuel input-based agricultural systems can reduce soil biodiversity, alter soil community structure and nutrient cycling, and lead to greater dependence on energy-intensive practices. *Microbial Ecology in Sustainable Agroecosystems* brings together soil ecologists, microbial ecologists, and agroecologists working globally to demonstrate how research in soil ecology can contribute to the long-term sustainability of agricultural systems. The book identifies five key areas of research that can be combined to support and direct sustainable land management practices: agriculture, biodiversity, ecosystem services, integrated soil ecology research, and policy. Topics include: A broad range

of soil microbial processes in terms of the importance of microbial heterogeneity Inputs by soil microorganisms into wheat-farming systems The importance of arbuscular mycorrhizal fungi in making nutrients more available to crops The benefits and environmental problems associated with the use of crops genetically modified with *Bacillus thuringiensis* The incorporation of soil ecological or microbial ecological theory into agricultural practice to improve agricultural productivity and sustainability Challenges in sustainable agricultural research and the need for coalescing new avenues of research in agriculture and soil ecology The contributors range from long-time ecological researchers to graduate students and early career scientists, representing a wide spectrum of experience, ages, diversity, and research

interests in this area. They cover the diversity and complexity of microbial activity and interactions in soil systems and the many ways in which microorganisms may be manipulated and managed to improve the functions of crop rhizospheres and thereby maximize crop yields and overall productivity. These recommendations can be used to direct and influence agricultural and environmental policy and guide future research in sustainable agricultural systems management.

the benefit of readers without a background in gaseous ion chemistry, a thorough review is presented in Chapter 2. Other chapters discuss such topics as reagent ion systems within the context of the thermochemistry and kinetics of the ionization process, including reactions and the type of information obtained; isotopic exchange reactions; stereochemical effects in chemical ionization; and reactive ion/molecule collisions in quadrupole cells. Chemical ionization mass spectra of 13 classes of compounds are discussed in detail to illustrate the influence of different functional groups on the spectra observed. Chemical Ionization Mass Spectrometry, 2nd Edition will be a valuable reference for anyone interested in mass spectrometry and gaseous ion chemistry in general.

environmental point of view, they show cases in diverse areas such as plains, mountains, forests, sea coast, steppes and puna. Likewise, the range of preys considered includes ungulates (camelids and deer), runner birds (*Rhea pennata*) and minor prey (mammals and fish). The book is aimed at professionals and students of archaeology interested in the analysis of tactics and strategies for prey capture. Every chapter offers an important contribution in theoretical, methodological and technical terms. In addition, these works possess a high comparative value on study cases of very different chronologies and environments of the Southern hemisphere. This book is a result of the 1st Workshop "Strategies and tactics in order to obtain preys in the past: its discussion from the integration of different lines of evidence"
