What is Frontal Fibrosing Alopecia (FFA)? FFA is a condition which causes hair loss, mainly over the hairline at the front of your head. It is a type of alopecia known as ' scarring alopecia ' or ' cicatricial alopecia ' . It is thought to be related to another condition called lichen planus which, when it affects the scalp, is called

Dermatology Department Frontal Fibrosing Alopecia

Women with frontal fibrosing alopecia (FFA) note a rapid onset of frontal hair recession. This recession usually includes the temporal hairline; however, the emergence of hair loss can be subtle and slowly progressive. A useful clue to the diagnosis is frequently the loss of eyebrows, a loss that can precede the frontal recession.

Frontal Fibrosing Alopecia - Dermatology Advisor

Frontal fibrosing alopecia usually presents as a uniform linear band of hair loss along the front and sides of the scalp hair margin, resulting in a receding frontal hair line. Atypical patterns of loss include a diffuse zig-zag pattern, a pseudo-fringe- sign , or continuous involvement all the way around the hair margin both front and back.

Frontal fibrosing alopecia: efficacy of treatment modalities.

Frontal fibrosing alopecia (FFA) is a form of lymphocytic cicatricial alopecia that presents as frontotemporal hairline recession, typically in postmenopausal women. 1 The condition is considered to be a variant of lichen planopilaris (LPP) due to its similar histologic appearance. 2 Loss of eyebrow 1-11 and body 5-11 hair also is commonly present in FFA, and histologic findings are identical to those for hair loss on the scalp, 8,9 suggesting that FFA may be a form of generalized alopecia.

Association of lupus and a frontal fibrosing alopecia: A ...

Frontal fibrosing alopecia is a form of scarring hair loss that affects the hair margin on the front of the scalp. This condition causes the frontal hairline to progressively recede over time. The rate of hair loss varies from person to person. Once the hair falls out, it will not re-grow in the area.
