Method or FRAM (Hollnagel, 2004 & 2012) provides a way to describe outcomes using the idea of resonance arising from the variability of everyday performance. To arrive at a description of functional variability and resonance, and to lead to recommendations for damping unwanted variability, a FRAM analysis consists of four steps:

Brief introduction to FRAM - FUNCTIONAL RESONANCE

The FRAM is a method-sine-model rather than a model-cum-method. The use of the FRAM therefore involves two stages. The first is using the FRAM to develop a model of the activity (process or performance) that is the focus of the analysis. The second is to use the model to create instantiations of the activity (or performance) and then to analyse

This is captured by the principle functional resonance that is the basis for the FRAM. THE FRAM is a method to analyse how work activities take place either retrospectively or prospectively. This is done by analysing work activities in order to produce a model or representation of how work is done.

Analysis Method (FRAM) The purpose of the FRAM is to analyse how something has been done, how something is done, or how something could be done in order to produce a representation of it in a reliable and systematic manner, using a well-defined format. This resulting representation is effectively a model of the

The Functional Resonance Analysis Method

In this context, the Functional Resonance Analysis Method (FRAM) appears to be a key tool for understanding how variability spreads through a system. That is, how, by these approximate adjustments, it is possible to dampen variability, keep it within proper performance limits and see how it increases in an unusual

There is an increasing interest in utilising the FRAM approach for the analysis of what exactly is going on in complex sociotechnical systems in practical high hazard environments. There are, for example, a number of ongoing projects at the moment in aviation, self-driving vehicles and, of course, on the challenges of the COVID 19 pandemic for healthcare responses.

The functional resonance analysis method (FRAM) is a system-based method to understand highly complex sociotechnical systems. Besides learning from safety occurrences or undesirable states, FRAM can be used to understand how things go well in a system, by identifying gaps between “work as imagined” (WAI) and “work as done” (WAD).
