of curves. Roughly speaking, local properties refer to small parts of the curve, and global properties refer to the curve as a whole. Examples of local properties include regularity, curvature, and torsion, all of which can be defined at an individual point. The global properties we reference include

Handout 2: Global properties of plane curves. Definitions. A plane curve $\gamma: [a,b] \rightarrow \mathbb{R}^2$ is closed if $\gamma(a) = \gamma(b)$. It is immersed if $\gamma'(t) \neq 0$ for any $t \in [a,b]$. Let $p \in \mathbb{R}^2$ be a point not on the curve γ . The winding number $w_\gamma(p)$ of an oriented closed curve γ around p is

Since $\kappa \neq 0$, γ is a plane curve. What we must now show is that every point of γ is at distance $1/\kappa$ from some fixed point—which will thus be the center of the circle. Consider the curve $\tilde{\gamma} = \gamma + (1/\kappa)N$. Using the hypothesis on γ , and (as usual) a Frenet formula, we find
