Before pericyclic reactions can be put to use in a predictable and controlled manner, a broad mechanistic understanding of the factors that influence these concerted transformations must be formulated.

Pericyclic Reactions - Michigan State University

The three principal types of pericyclic reactions are cycloaddition, electrocyclic rearrangement, and sigmatropic rearrangement: The factors that control if and how these cyclization and rearrangement reactions occur in a concerted manner can be understood from the aromaticity or lack of aromaticity achieved in their cyclic transition states.

21.11: Pericyclic Reactions - Chemistry LibreTexts

Pericyclic reactions stand in contrast to linear reactions, encompassing most organic transformations and proceeding through an acyclic transition state, on the one hand and concerted reactions, which proceed through a doubly cyclic, concerted transition state on the other hand. Pericyclic reactions are usually rearrangement or addition reactions.

Pericyclic reaction - Wikipedia

The four principle classes of pericyclic reactions are termed: Cycloaddition, Electrocyclic, Sigmatropic, and Ene Reactions. A Useful Mnemonic Rule Before pericyclic reactions can be put to use in a predictable and controlled manner, a broad mechanistic understanding of the factors that influence these concerted transformations must be formulated.

Abstract This chapter introduces pericyclic reactions, their classification and three principal mechanistic approaches, namely the orbital symmetry correlation approach, the transition structure (TS) aromaticity approach and the frontier molecular orbital (FMO) approach for analysis.

4 Mechanistic analysis of pericyclic reactions. The underlying principles of pericyclic reactions have emerged in various forms, and we will focus on the frontier molecular orbital (FMO) approach developed by Fukui in the 1950s. This allows the interpretation of a molecular interaction to be restricted to an analysis of the interactions between the highest occupied and lowest unoccupied molecular orbitals (HOMOs and LUMOs) of the reacting partners.

Pericyclic Reactions - STEREOELECTRONICS

• A pericyclic reaction is a concerted reaction that proceeds through a cyclic transition state. Pericyclic reactions require light or heat and are completely stereospecific; that is, a single stereoisomer of the reactant forms a single stereoisomer of the product.

Pericyclic reactions occur if the symmetries of π orbitals in the reactants and products match. These reactions are symmetry allowed. These reactions occur under relatively mild reaction conditions. A molecular orbital is symmetric if the signs on each side of the vertical plane are the same.
