In mathematics,

Read Free Proof Of Bolzano

specifically in real analysis, the Bolzano–Weierstrass theorem, named after Bernard Bolzano and Karl Weierstrass, is a fundamental result about convergence in a finite-dimensional Euclidean space \mathbb{R}^n . The theorem states that each bounded sequence in \mathbb{R}^n has a convergent

Read Free Proof Of Bolzano

subsequence. An equivalent formulation is that a subset of \mathbb{R}^n is sequentially compact if and only if it is closed and bounded. The theorem is sometimes called the sequential compactness theorem.

Finally, we present our proof of the Bolzano-Weierstrass Theorem. Proof. (By contraposition) Let S be a bounded subset of \mathbb{R} , and assume S has no limit point.

Suppose $X \subseteq S$ is nonempty. Then $\inf(X)$ is in X , lest $\inf(X)$ be a limit point of X , hence also of S .

Analogously, $\sup(X)$

 $\exists N \in \mathbb{N}$ $\exists n_1, n_2, \dots$
##.

~~Theorem. (Bolzano-
Weierstrass)~~

Bolzano's proof

Read Free Proof Of Bolzano

consisted of showing that a continuous function on a closed interval was bounded, and then showing that the function attained a maximum and a minimum value. Both proofs involved what is known today as the Bolzano–Weierstrass theorem. The result was also discovered later by Weierstrass in

proof of Lemma 2.

The Bolzano-Weierstrass Theorem follows immediately:

every bounded sequence of reals contains some monotone subsequence by Lemma 2, which is in turn bounded. This subsequence is convergent by Lemma 1, which completes
