1. Answer the pre lab questions.
2. Count to be sure you have 100 pennies to start with.
3. Put your pennies heads up in the box and shake.
4. Remove all the pennies that are now tails.
5. Count the remaining pennies and enter this data on your data table.
6. Repeat until you have no pennies left.
- 7.

16 Coins > 50% Decay rate (In
the first throw) > 8 Coins > 50%
Decay rate > 4 Coins > 50%
Decay rate > 2 Coins or less = 4
total number of throws going at a
decay rate of approximately 50%,
3 throws to reach 2 or less is the
most frequent number (also to
back up this claim a calculation
has been made by calculating the
most frequent number of throw to
get 2 or less over the total
number of 50 trials and the
average was 3.08 as provided in
the appendix).

Experiment - UKEssays.com

Penny Decay Radioactive decay follows 1st order kinetics and in the reaction, the concentration of the reactant decreases exponentially. The rate of the reaction equals the concentration of the reactant, $[A]$, raised to the first power times a proportionality constant, k , which is called the rate constant.

Secondly, the formula of the law of radioactive decay is tried to reach. In the modeling of nuclear decay, in the first model, 200 coins (each of which is 5krú) are used in an attempt to represent radioactive elements. (MEB, 2009) In here, it is important to lay on identical coins.

each shake, the number of pennies remaining is reduced by approximately half.

Skills Practice Lab Modeling Radioactive Decay with Pennies Causes and Types of Radioactive Decay: Radioactivity occurs because some nuclei are unstable. Alpha Decay: The nuclear strong force is a very short-range force, and large nuclei are pushing its limits. Occasionally an alpha particle (${}^4\text{He}$ nucleus) pops off. The new element has two fewer protons than the original element.
