The simplex method is a solution to the problem of linear programming by finding a feasible solution, and using an iterative procedure, developing solutions to an optimal solution [6]. (The simplex method starts with a feasible point and tests whether the value of the objective function is optimal. If this is not the case, then this method continues at a better point.

Researchers often identify robust design, based on the concept of building quality into products or processes, as one of the most important systems engineering design concepts for quality improvement and process optimization. Traditional robust design principles have often been applied to situations in which the quality characteristics of interest are typically time-insensitive.

In mathematical optimization, Dantzig's simplex algorithm (or simplex method) is a popular algorithm for linear programming.. The name of the algorithm is derived from the concept of a simplex and was suggested by T. S. Motzkin. Simplices are not actually used in the method, but one interpretation of it is that it operates on simplicial cones, and these become proper simplices with an ...
