Court orders TSA to finalize rule on full-body scanners ...

Back in 2008, the Transportation Security Administration (TSA) developed a plan to deploy whole-body imaging machines (WBI) at US airport passenger checkpoints. The plan called for using millimeter wave and backscatter X-ray devices to screen passengers for explosives and other non-metallic items prohibited on airplanes.

The Whole-Body Challenge – Homeland Security Today

In the United States, in 2010 the TSA required that their full-body scanners "allow exporting of image data in real time", and cases of the government's storing of images have been confirmed. In August 2010, it was reported that the United States Marshals Service saved thousands of images from a millimeter wave scanner.

Full body scanner - Wikipedia

Any person passing through a TSA checkpoint is legally allowed to opt out of the body scanner for any given reason. However, the TSA is still responsible for ensuring the safety of commercial flights, which requires screening for all commercial passengers. For those who opt out of the body scanner, the alternate option is the full body pat down.

The Three Inspection Options at TSA Checkpoints

Even as the question wound its way through courts, TSA deployed the machines and now uses 793 full-body scanners at 157 airports. Despite the administrative finality, critics say they will still...

TSA defends full-body scanners at airport checkpoints

A millimeter wave scanner is a whole-body imaging device used for detecting objects concealed underneath a person ' s clothing using a form of electromagnetic radiation. Typical uses for this technology include detection of items for commercial loss prevention, smuggling and screening at government buildings and airport security checkpoints. Several countries employ the scanners for security screening. It is one of the common technologies of full body scanner used for body imaging; a ...

Millimeter wave scanner - Wikipedia

The Transportation Security Administration wants to install more of the devices, known as whole-body imaging scanners, but the agency has met resistance from civil liberties groups, passengers and some members of Congress. Dallas/Fort Worth International Airport, the nation's third busiest, has just two of the machines.

How does the TSA control airport security in Amsterdam ...

TSA uses advanced imaging technology to safely screen passengers at the checkpoint. Advanced imaging technology uses automated target recognition software that eliminates passenger-specific images and instead auto-detects potential threats by indicating their location on a generic outline of a person. Select Filter.

Travel Tips: Advanced imaging technology | Transportation ...

image of the full body that highlights objects that are on the body. To mitigate the privacy risk associated with creating an image of the individual 's body, TSA isolates the TSA officer (the image operator) viewing the image from the officerTSA interacting with the individual. TSA

TSA Advanced Imaging Technology

TSA uses millimeter wave advanced imaging technology and walk-through metal detectors to screen passengers. Millimeter wave advanced imaging technology safely screens passengers without physical contact for metallic and non-metallic threats, including weapons and explosives, which may be concealed under clothing.

Security Screening | Transportation Security Administration

TSA Whole Body Imaging Page 2 Abstract The Transportation Security Administration (TSA) will conduct pilot operations to evaluate the use of various Whole Body Imaging (WBI) technologies, including backscatter x-ray and millimeter wave devices, to detect threat objects carried on persons entering airport sterile areas<sup>1</sup>. WBI creates an image of the full body, showing the surface of the skin and

October 17, 2008
